- Applications of Linear Differential (I Equations with Constant Coeff's (LDWCC)

Electrical circuit

The formation of Differential Equation for an electric circuit depends upon the following laws.

(i)
$$i = \frac{dq}{dt}$$

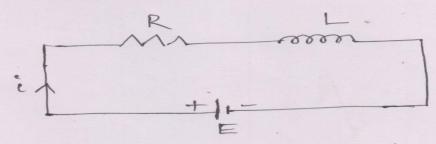

(ii) Voltage drop across resistance (R) = Ri (iii) Voltage drop across inductance (L) = L di (iv) Voltage drop across Capacitance (C) = 9/C

Kirchoff's Law

Voltage Law: The algebraic Sum of the Voltage drop around any closed circuit is equal to the resultant electromotive force in the circuit.

Current Law; At a junction (or nodes, Current coming is equal to current going.

L-R Series circuit

by voltage Law, Ri+L di = E

L-R-c circuit

by Voltage Law, $Ri + L \frac{di}{dt} + \frac{9}{C} = E$ (or) $L \frac{d^2y}{dt^2} + R \frac{d9}{dt} + \frac{9}{C} = E$ ('.' $i = \frac{d9}{dt}$)

(1) An electric circuit consists of an inductance 0.1 henry, a rebistance of 20 ohms and a Condenser of Capacitance 25 micro-farads. Find the charge of and the current i at any time 't', given that at t=0, V=0.05 cowlomb, i=0 when t=0Given L = 0.1 h, R = 20 12, C = 25 m.f = 25 x 10 farad The D.E. forthe given data is $L \frac{dy}{dt} + R \frac{dy}{dt} + \frac{y}{c} = 0$ It is operator form is $[D^{+}(R)D + \frac{1}{LC}]q = 0$ (on $D + (20)D + (0.1)(25 \times 10^6) = 0$ Clearly & = = -100t [4 cos (100 \(\sigma 39 t \) + & sin (100 \(\sigma 39 t \)) .. 9 = 9 = = = = [q cos (100 \(\frac{39}{2} \) + \(\frac{2}{2} \) in (100 \(\frac{39}{3} \) t) when t=0; q=0.05 & i=0, then $c_1=0.05$ $c_2=0.008$ i. 9 = = [0.05 cos (624.5t) + 0.08 sin (624.5t)]

De An inductor of 2 henries, resistor of 16 ohms and capacitor of 0.02 farads are connected in series with a battery of electromotive force E = 100 sin 3t. At t = 0, the charge on the Capacitor and Current in the circuit are zero. Find the charge and current.

Sol: Given L=2h; $R=16\Omega$; C=0.02 farad E=100 Sin 3 t.

The D.E. forthe given data is

 $L \frac{d^2y}{dt^2} + R \frac{dy}{dt} + \frac{9}{C} = E$

(on It's operator form is [D+RD+Lc]v=E

(on $\left[\frac{D}{2} + \left(\frac{16}{2}\right)D + \left(\frac{1}{2 \times 0.02}\right)\right]V = \frac{100 \sin 3t}{2}$

clearly $V_c = \frac{-4t}{e} \left[c_1 \cos 3t + c_2 \sin 3t \right]$

 $9/p = \frac{25}{52} \left[2 \sin 3t - 3 \cos 3t \right]$

 $V = V_c + V_p = e^{4t} \left[c_1 \cos 3t + c_2 \sin 3t \right] + \frac{25}{52} \left[2 \sin 3t - 3 \cos 3t \right]$

$$i = \frac{dq}{dt} = -4e^{4t} (c_1 c_3 sin 3t + c_2 sin 3t)$$

$$-3e^{4t} (c_1 sin 3t - c_2 c_3 st)$$

$$+ \frac{25}{52} (6 c_3 st + 9 sin 3t)$$
when $t = 0$, $q = 0$ & $i = 0$

$$i = \frac{75}{52} = \frac{75}{52} = \frac{50}{52}$$

$$i = \frac{25}{52} = \frac{4t}{3} = \frac{3c_3 st + 2sin 3t}{52}$$

$$i = \frac{75}{52} = \frac{2c_3 st + 3sin 3t}{52}$$

$$-\frac{25}{52} = \frac{4t}{3} = \frac{17sin 3t + 6c_3 st}{52}$$

Exercise:

- 6
- D For an electric circuit with L = 0.05 herry, R = 20 ohms and $C = 100 \times 10^6$ farad, the applied e.m. f is 100 volts. prove that the charge q at time t'is given by $q(t) = 0.01 \frac{200t}{200t} \left[0.01 \cos(400t) + 0.02 \sin(400t) \right]$ if initially q = 0 and i = 0
- An alternating E.M. F. Esimpt is applied to a circuit at t=0. Given the equation for the current is as $L \frac{d^2i}{dt^2} + R \frac{di}{dt} + \frac{i}{c} = pEcospt$. Find the Current i when $CR^2 > 4L$.
